Autodub: English-to-Hindi Video Dubbing

Oct 19, 2026 · @Aman Raza

Overview

Autodub is a program that automatically dubs an English-speech video into Hindi, free of cost.

How It Works

The program uses libraries together with Deepgram and Microsoft APIs. It translates a video through speech-to-text (STT) and text-to-speech (TTS).

Functions

The program is built from the following functions:

- **transcript_with_time**: extracts the audio in chunks and sends it to Deepgram, which returns the English script in paragraph form.
- **translate_safely**: translates every paragraph into a Hindi script.
- **make_tts_andsync**: generates the Hindi audio with the help of a Microsoft tool and synchronizes it with the video.
- **adjust_speed**, **adjust_volume** and **change_speed_keep_pitch**: three supporting functions that run alongside the synchronization step. Each does what its name says.

How to Use

The program is simple to use. It works inside the folder in which it was created.

1. Place your video in that folder.
2. Copy the video's full file name.
3. In the program, find the input box for the video name and paste the full name there.
4. Run the program.

The result is your video with Hindi audio.

Pros and Cons

Pros

- The length of the video does not matter for producing Hindi audio.

Cons

- It produces only one voice at a time.
- It has no lip sync.
- Video length still matters, because the video's duration has to match the timing of the audio.
